

Fig. 6.4. A Wavelet Tour of Signal Processing, 3<sup>rd</sup> ed. The convolution  $f \star \bar{\theta}_s(u)$  averages  $f$  over a domain proportional to  $s$ . If  $\psi = -\theta'$  then  $W_1 f(u, s) = s \frac{d}{du}(f \star \bar{\theta}_s)(u)$  has modulus maxima at sharp variation points of  $f \star \bar{\theta}_s(u)$ . If  $\psi = \theta''$  then the modulus maxima of  $W_2 f(u, s) = s^2 \frac{d^2}{du^2}(f \star \bar{\theta}_s)(u)$  correspond to locally maximum curvatures.
